

## **Nature of Solar Wind Turbulence at Kinetic Scales**

C. Chen, Imperial College, UK

I will present some recent observational results on small scale turbulence in the solar wind. In particular, I will discuss the location of the spectral break which marks the transition to the kinetic range, the nature of the fluctuations in the kinetic range, and the intermittency of the density fluctuations and magnetic field rotations here. I will discuss the implications for our understanding of kinetic turbulence and how it leads to plasma heating.
